20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Two data collection efforts at Travis AFB were undertaken to provide minority food preference and weight gain data to Air Force menu planners and individuals interested in the issues concerning body weight. White males, white females, black males, and black females were administered a new Food Preference Survey (FPS), a Food Selection Questionnaire (FSQ), and two kinds of arguments that conveyed nutritional information and encouraged either the inclusion or exclusion of certain food from a meal.

→ Provided in the present report are basic food preference data, validity and reliability data, and the results of the nutritional information experiment. Foods are ranked by decreasing hedonic mean and by decreasing frequency mean for each of the subpopulations, and the results of an analysis of variance on each of the 194 foods are given. Foods in the analysis are arranged by overall decreasing hedonic mean and by 31 food groups, thus permitting easy access by menu planners. The FSQ was found to be a valid instrument for assessing food selection and a moderately valid instrument for assessing the number of portions selected. The FPS was found to be moderately valid but highly reliable. Results are interpreted in light of the large number of variables that were not controlled. The selection of carrot sticks was increased either by argumentation or by making personnel aware that the item was available. Arguments encouraging the exclusion of desserts from a meal had no effect. Detailed analyses of food preferences and weights of personnel are reserved for later reports.

Preface

This study was conducted by the Behavioral Science Division, FSL, of the Natick Research and Development Command in response to United States Air Force Requirement 7-6, Prediction of Food Habit Changes in the USAF. It was conducted at Travis Air Force Base, CA. Special thanks are due to the Food Service Personnel at Travis for their cooperation and assistance.

Special acknowledgement and thanks are due to Barbara Edelman who assisted in the collection of the data and to Peter Priori and Nancy Cobean for their valuable aid in analyzing the data.

**The US Air Force Food Habits Study:
Part I, Method and Overview**

Introduction

In recent years an increased number of black and female personnel have been enlisted into the United States Air Force. Concomitantly there has been, on behalf of the Air Force, an increased interest in the issues surrounding body weight. Consequently, in 1976, a study was initiated to compare the food habits of the four subpopulations white male (WM), white female (WF), black male (BM), and black female (BF). Inclusion of other subgroups was considered unfeasible because of the relatively small numbers at bases queried.

The study was conducted in three phases at Travis Air Force Base, CA. The present report is the first of four and is largely concerned with methodology and the overview of the study. The first two phases developed along four lines. First, because knowledge of food preferences is an important factor in the construction of menus, preferences were established using a standard 9-point hedonic scale that enables the respondent to indicate how much he likes a food and a preferred frequency scale that enables the respondent to indicate how often he would like to eat a food (Peryam, Polemis, Kamin, Eindhoven, and Pilgrim, 1960; Moskowitz, Nichols, Meiselman, and Sidel, 1972).^{1,2} Earlier work by Meiselman (1977)³ focused on the preferences of whites and blacks and enables some important comparisons.⁴

Second, the study focused on the percentage of personnel who were overweight (OW), average weight (AW), and underweight (UW), weight gain, and the food preferences of the OW, AW, and UW. Conclusions were based on self-descriptions given in response to a number of demographic items that accompanied the hedonic scales and the height-weight tables prepared by the Metropolitan Life Insurance Company. Weights

⁴Ibid.

indicated by the tables are associated with the lowest mortality rates according to insurance company data. The work by Meiselman also focused on the food preferences of OW and lighter weight individuals and consequently enables important comparisons in this area.

Third, the study was designed to establish the reliability and validity of the instrument used to collect preference and weight data, the Food Preference Survey (FPS). Reliability was established using a variation of the test-retest method. A previous study by Waterman, Meiselman, Branch, and Taylor (1974),⁵ reported a test-retest correlation of 0.98 for hedonic mean preference ratings so that we expected to obtain a similar correlation. In order to establish the validity of the FPS, a second instrument, the Food Selection Questionnaire (FSQ), was developed. The FSQ was designed to determine what foods were being selected so that food selections could be compared with the preference data. We assumed that food preference is positively related to food choice (i.e., people select the foods that they like) and hoped that we could roughly predict choice behavior on the basis of a food preference measure. It was not intended to accurately predict choice behavior, since the number of variables other than food attitude, as for example, number of hours since last meal, that affect choice behavior under normal garrison conditions is too large to control given the resources available. Past studies (e.g., Peryam, et al., 1960)⁶ have reported correlations ranging from 0.59 to 0.77 with the larger correlations being obtained in highly controlled feeding conditions. More recently, Smutz, Jacobs, and Waterman (1974),⁷ examined in detail the food preferences and food choices of 10 Navy enlisted men and obtained correlations ranging mostly from 0.40 to 0.60. The FSQ was, in turn, validated by comparing reported selections with videotaped pictures of the foods actually selected.

Fourth, concern with nutrition as well as with weight control led us to investigate the effectiveness of nutritional arguments designed to influence food selection. In the study of the validity of the FPS, we examined the relationship between preference and choice behavior. Here our concern was with the relationship between arguments intended to intensify or change attitudes and the effect of these arguments on choice behavior. Several different kinds of arguments were constructed and administered to subjects just prior to their selection of a noon meal. Effects were assessed by means of a short questionnaire that accompanied each argument.

The relationship between food preferences and food choice in Naval enlisted personnel at the Naval Construction Battalion Center, Davisville, Rhode Island. United States Army Natick Laboratories Technical Report No. 75-52-FSL, October 1974.

An extensive analysis has been performed on the data collected at Travis, and presented in the present report are results pertinent to food preferences, the validity and reliability of the instruments used, and the effects of information about nutrition. Food preference results are elaborated upon in a second report while results concerning the weights of Air Force personnel are given in a third.^{8,9} A fourth report based on the third phase and focusing on food selection and perceived portion size is also anticipated.

Method

Food Preference Phase

Subjects. In preparation for the study, several Air Force bases were visited, and data relevant to the sizes of the four demographic groups were collected. Because the four groups were well represented at Travis AF Base, Travis was selected as the test site, and all subjects were active-duty enlisted personnel at Travis. For the food preference phase of the study of the personnel at Travis 5% of the WM, 50% of the WF, 12% of the BM, and 64% of the BF were requested from each of 18 tenant and permanent organizations (wings/squadrons) to complete surveys. Of a total sample of 710 respondents, 653 reported their race-ethnic background as being either Caucasian-White or Negro-Black, and of these 35.2% were WM, 32.3% were WF, 20.7% were BM, and 11.8% were BF. The obtained sample sizes as well as the mean age, time in service, grade, and education of the respondents is presented in Table 1.

Materials and Procedure. A newly constructed Food Preference Survey which contains 21 demographic questions and lists 200 foods, four of which are repeated and three of which are nonsense foods, was used to establish food preferences. Questions from the survey that were entered into the analysis were concerned with age (1) (numbers in parentheses are questionnaire numbers), height (2), race (4), sex (5), grade (7), rations allowance (8), years in service (10), specialty foods (15), and several questions about weight and dieting: present weight (3), weight upon entrance into the service (11), concern for present weight (18), dieting methods (19), and desired menu change (21).

Each of the 200 food items was accompanied by a 9-point hedonic scale, ranging from dislike extremely to like extremely, on which subjects indicated how much they liked or disliked a food, and a preferred frequency scale on which subjects indicated how often, in days per month, they wanted to eat a food. Subjects were instructed not to complete the hedonic and frequency scales if they had never tried a food. The Food Preference Survey is presented in Appendix A.

Over a four-day period, subjects were requested to attend afternoon sessions, approximately between 1300 and 1600 hours, at the Recreation Center where the surveys were completed. Subjects were administered the surveys in groups of about 80. Instructions for completing the surveys were verbally given prior to administration, and during administration, subjects were checked to insure that they understood the instructions.

Analysis. Mean preference ratings by the four subsamples for the food items were rank-ordered, and a 2 (either white or black) by 2 (either male or female) analysis of variance was performed on the preference data for each food item. Data for which a significant main effect or an interaction was found was further subjected to Tukey's test in order to determine which of the six possible two-mean pairs were significantly different, and the statistic eta was found for each main effect in order to establish the strength

of the relationship between the factor (either race-ethnic background or sex group membership) and the preference ratings. Eta squared is interpreted as the proportion of variance, or the amount of difference, in the preference ratings that can be attributed to the factor in question. While the mean preference ratings entered into the rank orderings for each of the four subsamples were based on the total number of individuals making up the subsamples, the four subsamples entering the analyses of variance were based on individuals selected from each of the groups. Respondents were selected from the groups in order to establish approximately equal sample sizes. Cell sizes of the four groups for each of the 200 foods are presented in Appendix B. Cells sizes that were different by more than 10 were arbitrarily judged unequal and are so denoted by the letter U; cell sizes that differed by 10 or less were judged equal and are denoted by the letter E. As the missing data for some foods was greater than that for other foods, the analysis of variance for 52, or approximately 26%, of the foods was based on an upper limit cell size of 40. Initially, individuals were selected for inclusion into a group provided they had responded to approximately 83% of the 52 food items. As cell sizes of 40 for each of the 52 foods were not obtained, individuals were then selected who had responded to at least 77% of the food items, and the selection process was continued until cell sizes of 40 were obtained or all eligible subjects were exhausted. The analyses of variance for the remaining 145 items, or 74% of the foods, was based on an upper limit cell size of 70; the selection criteria were 90% and 83% completion of the 145 food items. A second set of analyses of variance was also performed upon the ratings, but the groups were composed of all eligible respondents. Means and standard deviations, however, are not reported.

The 200 foods were categorized into 31 food categories, and an average score for each category was found for each subject. A score for any one respondent for any one category was the average of that respondent's scores for the foods within the category in question. All subjects were used. Not all foods were used, however. Thirty-nine foods for which there were 500 or fewer responses each were omitted from their respective categories. They are given in Appendix C. Data for each of the categories was subjected to a 2 (white, black) by 2 (male, female) analysis of variance. Where appropriate, Tukey's test was performed, and eta's were found. The 31 food categories were also entered into several discriminant analyses, using Rao's method, where the groups were either male and female, white and black, or WM, WF, BM, BF. The minimum F for the stepwise selection procedure was 3.0; the minimum F to avoid removal from the stepwise analysis was also 3.0. Additionally, an average score was found for the 36 foods judged to contain high amounts of fat, and a 2 (white, black) by 2 (male, female) analysis of variance and Tukey's test was performed on the data. Finally, eighteen 4 (the 4 subsamples) by 2 (either selected or did not select) contingency tables were constructed to establish preferences for each of 18 specialty foods, and chi squares and eta's were found.

All subjects who reported height and weight information were classified, using the weight intervals of the medium frame column of the Metropolitan Life Tables, as either overweight (OW), average weight (AW), or underweight (UW). The analysis of these data was similar to that of the ratings grouped by race-ethnic background and sex group

membership. First, foods were rank ordered by decreasing hedonic mean and frequency mean. Second, the hedonic ratings of each food were submitted to a one-way (either OW, AW, or UW) analysis of variance, and Tukey's test was used and eta values were found whenever significance was obtained. All respondents were used, however, so that group sizes were unequal. The analysis was repeated using only female respondents. Third, scores were averaged within each of the 31 food categories, and an analysis of variance was performed on the ratings of each category. The 31 food categories were also used in two discriminant analyses to differentiate first, among the weight groups OW, AW, and UW and second, between the groups OW and AW.

The frequency of occurrence of the OW, AW, and UW was established both upon entrance into the service and after entrance into the service through two 4 (WM, WF, BM, and BF) by 3 (OW, AW, UW) contingency tables. The frequency of occurrence of concern for present weight was established through a 4 (WM, WF, BM, BF) by 2 (concerned, not concerned) contingency table. Five 4 (WM, WF, BM, BF) by 2 (either used or did not use a particular dieting method) tables, one for each of five dieting methods, were used to determine which methods were used by the four groups. Respondents were also asked to indicate how the dining facility could alter their menu to aid in personal weight control programs. For each of seven types of food, as for example, meats, subjects could suggest that more of the food should be served, that fewer foods of a kind should be served, that a greater variety of the food should be served, or that the quantity and variety was "OK as is." Seven, one for each of the seven types of food, 4 (WM, WF, BM, BF) by 4 (four types of suggested changes) tables were used to determine the kinds of changes desired by each of the four groups. Chi squares and eta values were found for each table. Fifth, t tests for correlated samples were performed on each of eight groups where each group served as its own control and where present weights were contrasted with weights upon entrance into the service. All respondents entering into the analysis were those classified as overweight, and their time in service was two years or less. Individuals making up four of the groups held a meal card and received rations while those making up the other four did not receive rations, and the groups were either WM, WF, BM, or BF. The analysis was repeated for those classified as average weight and then once again for those classified as underweight. The design allowed us, first, to determine whether the respondents in question gained weight while in the service and, second, whether those who were likely to eat in the dining facilities gained more weight than those who did not. In order to increase sample sizes, the first of these three analyses was repeated, but rather than using the groups WM, WF, BM, and BF, the groups white, black, male, and female were used. Additionally, to aide in the analysis, a 3 (OW, AW, UW) by 2 (either received or did not receive rations) contingency table was constructed.

Food Selection Phase

Subjects. Table 2 presents the number of subjects by dining hall, day, and meal who participated in the food selection phase of the study. While the data pertaining to food selection was based on all the subjects, data pertaining to the validation of the

FSQ was based only on the subjects who were sampled in Dining Hall 1. The obtained sample sizes, mean age, time in service, grade, and education of respondents who completed the FPS and whose data was used to establish the reliability of the FPS is presented in Table 3. The number and percent of white males and females and black males and females who participated in the nutritional information phase of the study is given in Table 4.

Materials. The Food Selection Questionnaire is a machine-scorable instrument designed to allow the subject to indicate the foods he selects and the number of servings of each food that he selects. Eighteen forms, one form for each of 18 meals, were used to gather data for validating the Food Preference Survey. An example is provided in Appendix D. Questionnaires are two or three "face only" pages long, depending upon the number of possible food selections. The day, meal, and dining hall are given on each page but the first, and the page and subject number can be coded on all but the first page, which is the same for all forms and consists of instructions and an example. On the second page, subjects are asked to indicate their sex and race, and on the second page and possible third page, foods making up the menu for a meal are listed. Below each food name is the amount of that food that defines one serving. Subjects indicate their food selection and the amount of each food selected by filling in, using a No. 2 pencil, response boxes that are to the right of the food listing. One column of response boxes, headed with the question "WHAT FOODS DID YOU SELECT," are used for the food selections. Four columns, which are headed with the question "HOW MANY SERVINGS DID YOU SELECT," and making a four-point scale for each food item, are used for food quantity. Columns are individually labeled either $\frac{1}{2}$, 1, $1\frac{1}{2}$, or 2 allowing the subject to select and record $\frac{1}{2}$ to 2 servings of each food selected.

The accuracy of the reported selections was checked by making observations of the actual food selections of the respondents. Data for validating the questionnaire was collected by means of two Sony AVC 3400 black and white video cameras and two Sony AV8400 $\frac{1}{2}$ -in. video tape recorder/playback units. So as to identify covered foods and insure accuracy, verbal descriptions of the selections were also recorded. Each camera was mounted on tripods which, in turn, were mounted to the surface of a standard 42-in. wheeled projection table. Subjects placed their trays upon a shelf that extended 15-in. out from the top of a table and that was directly under the camera which pointed straight down. Trays were secured by means of 3 narrow strips of wood that were taped to the shelf and that formed a ridge on either side and to the rear of the tray. A high source 150 watt flood lamp was also mounted on each tripod. Focus and tray position were checked by means of two Sony 9-in. monitor receivers.

Also developed for the study were short one-paragraph arguments that were used to convey information about nutrition and to encourage either the exclusion or inclusion of certain foods in a meal. Arguments explained what it meant for a food to be considered good (or bad), were supported by reasons, and varied from 116 to 167 words in length. Some of the arguments were designed to decrease the consumption of desserts and some

to increase the consumption of carrots, and arguments were either largely vague, suggestive, and emotive or specific and factual.

In the 116-word emotive argument encouraging the increased consumption of carrots, the goodness of carrots was defined positively by noting that carrots contain vitamin A and by pointing to events supposedly consequential to ingesting vitamin A. Five vague suggestive events, as, for example, real health and true freedom, are given. Three human rights, as, for example, the right to full development and to freedom, are presented in support of the judgment. In the informative argument, consisting of 124 words, good was largely negatively defined by pointing to events dependent upon the absence of vitamin A. Presented in the arguments were three specific consequences, for example, softening of the eyes and an inability to see in the dark, and decreased resistance to infection and the one general positive consequence of normal bodily functioning. In a combined argument, 167 words in length, both the emotive and the informative definitions and supporting reasons were presented together in a single paragraph.

In arguments discouraging the consumption of desserts, the eating of desserts was equated with overeating and the badness of overeating was defined by presenting events consequential to overeating. Presented in the emotive argument were three suggestive consequences, as, for example, premature death and loss of freedom, and in support of the judgment, four rights, for example, the right to happiness that accompanies real health and the right to nutritious foods low in calories. Presented in the informative argument were ten specific consequences, for example, physical unattractiveness and heart disease, and the two suggestive consequences — poor health and shortened life.

The effect of being made aware of the availability of carrots and desserts was controlled by presenting some subjects with a four-item questionnaire, without an attached argument, on which they indicated whether or not they included carrots or a dessert in their meal. The procedure enabled a comparison of the effects of the arguments with a condition in which no arguments were presented but in which subjects were aware, by means of the four-item questionnaire, that carrots and desserts were present. Arguments and accompanying instructions are presented in Appendix E.

Procedure. Two groups were tested in order to validate the FPS. The first group, which was also used to establish the reliability of the FPS, consisted of 100 subjects (see Table 4) and was tested at the Crosswinds Recreation Center. Each of these subjects received 12 FSQ's and a FPS, each stamped with the same subject number and each collated into a single packet. While at the Center, subjects completed the FPS and were instructed to complete one FSQ for each of four noon meals the following week. So as to enable personnel to eat in the dining hall of their choice, they were given 12 questionnaires, four for each of the three halls. The purpose of the testing was to enable a comparison of stated food preference with food selection for the same subject.

The second group, consisting of 1,689 subjects, were men and women who were given the FSQ during meal times at the dining halls. Questionnaires and pencils were distributed

by two individuals to personnel as they entered the halls. Subjects were instructed as to the general nature of the study, were asked to complete the questionnaire sometime during their meal, and, upon completion, to leave the questionnaires with their trays, on the tables. Questionnaires were collected as soon as subjects left their tables. Subjects who participated in the validation of the FSQ were also asked to have a "picture" taken of their meals. Cameras were positioned so as to be close to the salad bar, near the end(s) of the food line(s), and adjacent to the major flows of traffic. This allowed the video-taping of meals after subjects left the food line and obtained a salad but before they sat down. Verbal descriptions of the food trays and subject numbers were also recorded. Two individuals were required to operate the cameras, and one person was required to direct subjects to the cameras. The FSQ was distributed and video-taping occurred in Dining Hall 1 (DH1) during breakfast, dinner, and supper for two days. Each video-taped meal was scored for food selections and portion sizes, and the data were coded on pages that duplicated the food listings and response columns of the FSQ. The FSQ was distributed during dinner and supper in Dining Hall 7 (DH7) for an additional two days, but food selections were not taped. By using two halls, a more heterogeneous sample was obtained, and the imposition upon subjects was minimized.

Several days preceding the distribution of questionnaires in Dining Halls 1 and 7, the number of individuals grouped by race and sex who selected carrot sticks or a dessert during a noon meal in these dining halls were recorded. During the week following the distribution of questionnaires, the arguments conveying the nutritional information and the four-item questionnaire were distributed by two individuals during a noon meal in each of three dining halls, Dining Halls 1, 7, and 3 (DH3). When observations were made or materials distributed, carrots were only available in the form of carrot sticks which were served in steam table pans at the salad bars.

The four-item questionnaire was distributed first, and in an attempt to minimize discussion as well as a possible modeling effect, the nutritional information was distributed to every other individual. Materials were handed to subjects as they entered the halls, and subjects were instructed first, to read the nutritional information (or the questions on the four-item questionnaire), second, to select their meals, and third, to answer the questions at their tables. Subjects were asked not to discuss the information with anyone and to leave the materials with their trays, on the tables. Materials were collected as subjects left their tables.

Analysis. The initial analysis was concerned with the validity of the FPS and consisted of a comparison of food selection differences with hedonic differences. For the data collected at DH1, 2 (either selected or did not select) by 2 (either white or black) contingency tables as well as 2 (selected, did not select) by 2 (either male or female) tables were constructed for each item, and chi squares and eta values were found. Here, eta squared is interpreted as the proportion of variance in the dependent variable, frequency of selection, that is attributable to the independent variable, either race-ethnic background or sex group membership. In the case of DH7, because few female personnel were in attendance (less than one percent were female), only data from male respondents were

used. Contingency tables were 2 (either WM or BM) by 2 (either selected or did not select). The rationale for constructing these tables was that some degree of consistency was expected to be obtained between hedonic differences due race-ethnic background or sex group membership and selection differences due to these factors. Complete isomorphism was not expected as conditions necessary for a one-to-one correspondence were not present. Hedonic differences entering into the analysis were those based on the data collected from the first Travis visit. Note that only the data for the 38 food names that appeared in both the FPS and FSQ, and for which there were either significant preference differences or selection differences, were used in this part of the analysis of the validity of the FPS. Using a more conventional approach, the mean frequencies with which 135 foods were selected were correlated with mean preference ratings for the same foods. Reliability was established by correlating the 200 mean preference ratings obtained during the first trip with the mean preference ratings that were obtained during the second data collection trip. Pearson product moment correlations were used.

The food selections of the majority of personnel attending the six meals that were studied in DH1 were videotaped and verbally described. In the analyses of the validity of the FSQ, 109, one for each food recorded, 2 (subject either reported he selected or did not select) by 2 (observers either recorded he selected or did not select) contingency tables were used. An additional one hundred and nine 4 (subject either reported 0.5, 1.0, 1.5, or 2.0 servings) by 4 (observers either recorded 0.5, 1.0, 1.5, or 2.0 servings) tables were constructed to analyze the utility of collecting portion size data by means of the FSQ. Chi square and eta values were found. Ideally, reported selections should be isomorphic with the observed selections.

Arguments conveying nutritional information were administered during a noon meal in DH1, DH7, and DH3. Arguments either encouraged the selection of carrots and were either emotive, informative, or combined, or they discouraged the selection of desserts and were either emotive or informative. A control condition in which subjects were made aware of the availability of the food in question but in which arguments were not presented was also used. Consequently, a 4 (either emotive, informative, combined, or control condition) by 2 (either selected or did not select carrots) and a 3 (either informative, emotive, or control condition) by 2 (either selected or did not select a dessert) contingency table was constructed, and the usual statistics were calculated. A week prior to the administration of the arguments, the number of people who selected carrots and desserts in both DH1 and DH7 were recorded. These data were contrasted with the proportion of people who selected carrots under the various conditions in order to determine the effects of the conditions relative to a base line.

Results

First, basic information concerning preferences for individual food items is presented. Second, results pertinent to the validity and reliability of the FPS and to the validity of the FSQ are given. Finally, the results of the Nutritional information experiment are given.

Food Preferences

Given in each of the Tables 5 to 9 are two separate listings of the 200 foods. The first listing in each table is by decreasing hedonic mean, and the second listing is by decreasing frequency mean. Tables are for WM, WF, BM, BF, and all respondents, Tables 5 to 9, respectively. Results, though similar, were not identical with past results (Meiselman, Waterman, and Symington, 1974).¹⁰ For example, grilled steak, rather than milk, received the highest mean rating by all respondents. Some of the differences very likely reflect the different populations sampled in the present study. Tossed green salads, for example, which is a high preference food of females, ranked fourth overall in the present study while it ranked 28th in the Meiselman, et al. study.

Results of the analysis of variance performed on the ratings of each of the individual food items is given in Table 10. Foods are first presented by overall decreasing hedonic mean and second, by 31 food groups, arranged in the order in which a meal is normally served. Individuals who are interested in the food preferences of the four subpopulations within the context of food groups should consult the second of the two listings presented in Table 10. The best way to use the second listing of Table 10 is to first turn to the food group for which information is needed and locate the column labeled MAIN EFFECTS. A number in this column indicates a preference difference exists among or between groups, and since these numbers are eta values, the larger the number the stronger the relationship between group membership and preference differences. Second, the user should consult the mean hedonics in order to determine actual group preferences. The user may consult the columns labelled TUKEY'S TEST in order to determine whether a difference between any two groups is statistically significant. An asterisk in one of these 6 columns indicates a significant preference difference occurred between the two groups indicated by the heading of the column.

Out of a possible 193 food preference differences, 86 (45%) were found; 61 (71%) food preference differences were associated with race-ethnic background, and 25 (29%) were associated with sex group membership. Based on Table 10 and the results of other analyses, we found that while white respondents seemed to have preferred soups, stews,

¹⁰H. L. Meiselman, D. Waterman, and L. E. Symington. Armed Forces food preferences. United States Army Natick Development Center Technical Report, 75-63-FSL, December 1974.

and puddings, blacks preferred fruit drinks and juices (though not tomato juice), hot breads, breakfast cereals, green vegetables, and fresh and canned fruit. The category breakfast cereals strongly discriminated between whites and blacks. Preference differences for fruit juices and drinks and for a number of green vegetables replicated prior findings (Meiselman, 1977).¹¹ Males were found to have preferred beer, eggs, meats, and pies while women were found to have preferred appetizers, potatoes, vegetables, salads, and fruit, and some of these results were consistent with earlier findings. These results and others are given in detail in other reports.^{12,13}

Validity of the FPS

Two methods were used to establish an estimate of the validity of the FPS. The first involved the rationale that if one group prefers a food more than another group, that group should select that food more often than another group. If, for example, whites rate milk higher than blacks, we would expect a greater percentage of whites than blacks to select fresh milk. Foods for which there were either significant selection differences or hedonic differences are given in Table 11. For each of these 38 foods, selection differences were compared with the preference differences. Agreement between the direction of a selection difference and the direction of a mean hedonic difference is indicated for each food by an asterisk in the last column of the Table. Of the total number of contrasts, there was agreement in 27 or 71% of the cases.

In the second more standard approach, we simply assumed a positive correlation between preference and selection so that increases in preference should be accompanied by increases in selection. Using the data provided in Table 11, the proportion of people who selected each of the 38 foods was correlated with the mean hedonic score for each of the foods. A coefficient of 0.48 was obtained for white respondents, and a coefficient of 0.34 was obtained for black respondents. Correlations were also obtained for all 135 foods that we were able to study from the 10 meals that were observed. Across all foods, a correlation of 0.48 was obtained.

There are a number of variables, other than food preferences, affecting food selections which, because they were uncontrolled, may account for the low correlations. Appearance of the food, for example, which in turn depends upon food quality and food preparation, affects food selection. As food selection occurs within the context of a category or type of food, as, for example, entrees or desserts, preferences for the other foods making up the category affect selection. Because only small quantities of a food were prepared, that food may soon have become unavailable and, consequently, selection measures could

¹¹ See footnote 3.

¹² See footnote 8.

¹³ See footnote 9.

have been affected. Appearance of the person serving the food, what each person had the previous meal, and how long each person had gone without eating are additional variables.

Reliability of the FPS

The reliability of the FPS was established by correlating the mean preference ratings of the March 1977 sample with the mean ratings of the January 1978 sample. A coefficient of .94 was obtained indicating that the FPS is a very reliable instrument. Note that the correlation was between two distinct samples, when usually the same sample is used, and that the second sample was tested 9 months after the first.

Validity of the FSQ

There are several possible measures that might be used to validate the FSQ. Two of these are eta, the correlation coefficient or strength of association measure, and percent hits and misses. Eta in the present context was used to measure the relationship between reported selections and observed selections. That is, eta was used to index the amount of observed food selection variability that could be accounted for by, or related to, the reported food selection. Percent hits refers either to the percent of respondents who did not indicate a selection and for whom none was observed or to the percent of respondents who indicated a selection and for whom one was observed. Conversely, percent misses refers either to the percent of respondents who did not indicate a selection but for whom a selection was observed or to the percent of respondents who indicated a selection but for whom none was observed. Note that the latter category of percent misses, selections are reported but not observed, includes cases where foods were obtained after observations were made, as, for example, when respondents obtained a salad or some other food item after observations were made, and includes cases like jellies and jams which are difficult to record and make note of when observations are made. These sources of error are, under good conditions, subject to control and are more easily controlled than error occurring in the first category of percent misses, where selections are not reported but are observed. Mean eta values and the mean percent hits and misses for each of six meals are summarized in Table 12. Also given in Table 12 are the median eta values and an adjusted mean value. The median values provide an estimate of the average correlation free from the effect of extreme eta values, and the adjusted mean provides an estimate that is based only upon those foods for which there were a sufficient number of respondents to meet standard criteria for the chi square test. These estimates indicate that at best the validity of the food selection column of the FSQ is 0.73. That is, about 53 percent of the observed food selection variability can be associated with the reports of respondents. The mean percent misses was 9.4 percent; approximately 9 out of 100 times either respondents failed to accurately report or we failed to accurately record a food selection. As a measure of food selection, the FSQ is a useful instrument.

Separate estimates were made of the validity of the FSQ as a measure of the quantities of the food selected. As the measurement of amount is more complex than the

measurement of selection, we expected the questionnaire to be less valid for this purpose. Mean correlations between reported and observed quantities of food selected and the mean percent misses for the foods served during the six meals monitored in DH1 are presented in Table 13. The mean correlation for the six means was 0.50, and the mean percent misses was 20.0.

There are a number of variables that readily affect the reporting and observing of quantities of food selected and which may account for the low correlation obtained between reported and observed quantities. Distinguishing among servings measured by ladle or serving spoon, for example, is sometimes difficult, and second servings of any food may be reported but, because of the difficulties of videotaping second servings, may not be observed. The number of meat slices or pieces that defines a serving varies with the size of the slices or pieces being served, and this in turn prevents an accurate definition of a serving. And the counting of meat items is sometimes difficult because one or more meat items may be hidden by another item. Because these latter contingencies were not controlled, meat items served by the number of slices or by the number of pieces were omitted from this part of the analysis.

Nutrition Information Experiment

During the January 1978 visit, arguments conveying nutritional information and encouraging either the inclusion of carrots in a meal or the exclusion of desserts were administered during a noon meal in each of three dining halls. Results pertinent to this portion of the study are provided in Tables 14 and 15. Arguments encouraging the selection of carrots were either emotional, factual, or consisted of a combination of emotional and factual material. In the control condition, subjects did not receive an argument but were made aware that carrots and desserts were available. A chi square performed on the relevant data was not significant ($p = 0.60$) indicating that in terms of statistical significance, the effects of the three arguments were about the same. Thus the effect of the emotional argument was neither more nor less than the effect of the combined argument, and the effects of the arguments were about the same as the effect of merely making people aware that carrots were available. However, people who received the nutritional information or who were made aware of the availability of the carrots selected more carrots than those who did not receive any information at all (Critical Ratio = 3.34, $p \approx 0.0005$, one-tailed test). Results indicated that making people aware of a food item increases the rate with which the item is selected. We should point out, though, that the effect could have been due to the fact that subjects were aware that a study was being conducted and that they felt they were supposed to select carrots. Also note that although statistical significance among the three arguments was not obtained, the magnitude of the means given in Table 14 indicate that the argument consisting of a combination of emotional and factual material had the greatest effect, the informative argument had an intermediating effect, and that emotive argument had the least effect.

The effects of the two arguments, emotive and informative, that discouraged the inclusion of desserts in a meal did not differ significantly from each other or from the control condition ($p = 0.66$). The effects also did not differ from the proportion of individuals who selected desserts but did not receive an argument and who were not informed that desserts were available.

We also examined the effect of the location of the carrots. Data are taken from Table 15. When carrots were located at the beginning of the serving line, as was the case in DH7, the proportion of individuals who selected carrots was 0.13. When they were located at the end of the line as was the case in DH1, the proportion of those who selected carrots was 0.11. But the difference was not significant ($p = 0.19$, one-tailed test). It is possible, however, that the full effect of the location was masked by the fact that personnel passed on either side of the salad bar in DH7, and the carrots were located only on one side.

Conclusions

Only a few of the conclusions of the USAF Food Habits Study are given in the present report. As preference differences were found for 45% of the 193 foods listed in the FPS, we can safely conclude that food preference differences did exist among the 4 subpopulations that were studied. Knowledge of these differences will enable menu planners to insure that current menus include the high preference foods of each of the subpopulations. The FPS was found to be highly reliable and moderately valid meaning that AF personnel tend to consistently rate foods and, to a lesser extent, to select highly rated foods over lower rated foods. The FSQ, which was employed to validate the FPS, was found to be a valid instrument for assessing food selection. Finally, it was possible to control to a limited extent the food selection of some of the respondents, but while it was possible to increase the frequency with which a vegetable is selected, it was not possible to decrease the frequency with which dessert items were selected. Nutritional information might profitably be used in weight control programs to increase the consumption of high nutritive low calorie foods.

Tables 5 to 9

Given in each of the Tables 5 through 9 are two separately ranked listings of the 200 foods. The first listing in each table is ranked by decreasing hedonic mean, and the second listing is ranked by decreasing frequency mean. Tables are for WM, WF, BM, BF, and all respondents, respectively. Mean hedonics and frequencies are accompanied by standard deviations and sample sizes (N), and each listing is accompanied by the percent of all respondents who never tried, and the percent who have tried, each of the foods.

Table 10

Given in Table 10 are two listings of the results of the 2 (either white or black) by 2 (either male or female) analysis of variance performed on the preference ratings of each of the 193 foods. In the first listing, food items are ranked by decreasing hedonic mean. In the second listing, food items are grouped into 31 food categories, and the categories are arranged in the order in which a meal is normally served beginning with appetizers and ending with desserts. In the first eight columns following the food name and identification number are the mean preference ratings and the rank order of the mean ratings for each food given by group — either white male (WM), white female (WF), black male (BM), or black female (BF). Significant differences occurring between white and black respondent or between males or females are indicated in the following two columns by the correlation coefficient, eta. Eta is a measure of the strength of the relationship between a factor, either race-ethnic background or sex group membership, and the preference ratings, and larger values of eta indicate stronger relationships. An asterisk in the column headed by IN (interaction) indicates an interaction was obtained between race-ethnic background and sex group membership. An asterisk in one of the last six columns indicates a significant preference difference was obtained between the two groups indicated by the heading of the column in which the asterisk is found. All values are based upon groups of approximately equal size. Note that as a consequence values will not correspond exactly to values based upon all respondents.

Table 11

Provided in Table 11 are the 38 foods that appeared in both the FPS and FSQ and for which there were either significant selection differences or significant preference differences. Given in the first four columns following the food name are percents and group sizes relevant to the food selections of either whites and blacks or males or females. An eta value, the index of the strength of the relationship, in the fifth column indicates a significant selection difference was obtained. Mean ratings are given in the next two columns and given in the seventh column are eta values which indicate significant hedonic differences. Agreement in the direction of the difference is indicated in the last column by an asterisk.

Table 11

Significant Selection Differences and Significant Hedonic Differences*

ID	Food Name	Whites % Who Selected	Group Size	Blacks % Who Selected	Group Size	Strength of Association	Whites Mean Hedonics	Blacks Mean Hedonics	Strength of Association	Agreement

Appendix A
Food Preference Survey

FOOD PREFERENCE SURVEY

U.S. ARMY NATICK RESEARCH AND DEVELOPMENT COMMAND

JANUARY 1977

Instructions for all questions: Read each question and mark the correct answer by filling in the appropriate oval, like this ① ② ③ ④ or by marking the oval opposite the correct answer. Several of the questions need more than one answer. Please read the special instructions carefully.

1. Indicate your AGE at your last birthday.

1st Digit	2nd Digit
① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩	① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩

EXAMPLE:
If you are 21 years old:
Darken oval ② in the left column and darken oval ① in the right column.

2. Indicate your HEIGHT in feet and inches.

FEET	INCHES
① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩	① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩

3. Indicate your present WEIGHT in pounds.

1st Digit	2nd Digit	3rd Digit
① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩	① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩	① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩

EX. 137 pounds
Darken ① ③ ⑦

4. Indicate your RACE/ETHNIC BACKGROUND.

☐ Caucasian/White
☐ Negro/Black
☐ Oriental
☐ Mexican American
☐ Other (specify) _____

5. Indicate your SEX.

☐ Male
☐ Female

6. Indicate your MARITAL STATUS.

☐ Married, Living Together
☐ Single, Divorced, or Separated

7. Indicate your PRESENT GRADE.

☐ E-1
☐ E-2
☐ E-3
☐ E-4
☐ E-5
☐ E-6
☐ E-7
☐ E-8
☐ E-9
☐ Officer/CWO

8. Do you receive a SEPARATE RATIONS ALLOWANCE (money instead of free meals)? Indicate the correct answer.

☐ Yes
☐ No

9. Indicate your HIGHEST LEVEL OF EDUCATION.

☐ Finished Grade School
☐ High School Graduate (including GED)
☐ Skilled Job Training After High School (Trade School)
☐ Some College
☐ College Graduate (include graduate work)

Less than one year

YEARS

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 PLUS

- ☐ New England (Me, NH, Vt, Mass, RI, Conn)
- ☐ Middle Atlantic (NY, NJ, Penn)
- ☐ East North Central (Oh, Ind, Ill, Mich, Wisc)
- ☐ West North Central (Minn, Ia, Mo, ND, SD, Neb, Kan)
- ☐ South Atlantic (Del, Md, DC, Va, WV, Ga, Fla)
- ☐ East South Central (Ky, Tenn, Ala, Miss)
- ☐ West South Central (Ark, La, Okla, Tex)
- ☐ Mountain (Mont, Ida, Wyo, Colo, NM, Ariz, Ut, Nev)
- ☐ Pacific (Wash, Ore, Cal, Alaska, Hawaii)
- ☐ Other Territories, Possessions or Countries

☐ On post bachelor quarters (barracks)
☐ On post family quarters
☐ Off post bachelor quarters (alone)
☐ Off post quarters with other airmen or friends
☐ Off post with parents or close relatives
☐ Off post family quarters

☐ prepare all of them yourself?

☐ prepare 75% of them yourself?

☐ share preparation 50/50 with others?

☐ prepare 25% or less?

☐ prepare none; Someone else does all the cooking?

1st Digit	2nd Digit	3rd Digit
0	0	0
0	1	1
0	2	2
0	3	3
	4	4
	5	5
	6	6
	7	7
	8	8
	9	9

Indicate your **TOP THREE CHOICES**.

<input type="radio"/> Chinese	<input type="radio"/> Greek	<input type="radio"/> Natural Foods	<input type="radio"/> Seafood
<input type="radio"/> French	<input type="radio"/> Italian	<input type="radio"/> Polish & Eastern European	<input type="radio"/> Vegetarian
<input type="radio"/> Fast Foods (hamburgers, etc.)	<input type="radio"/> Japanese	<input type="radio"/> Soul	<input type="radio"/> Other (specify)
<input type="radio"/> German	<input type="radio"/> Jewish	<input type="radio"/> Southern	
<input type="radio"/> General American Style	<input type="radio"/> Mexican	<input type="radio"/> Spanish (Not Mexican)	

16. How many PEOPLE usually EAT MEALS WITH YOU?
Indicate one answer for Each Meal.

BREAKFAST
<input type="radio"/> I don't usually eat this meal
<input type="radio"/> None, I eat alone
<input type="radio"/> 1 to 3 other people
<input type="radio"/> 4 to 6 other people
<input type="radio"/> 7 to 10 other people
<input type="radio"/> More than 10 people
LUNCH
<input type="radio"/> I don't usually eat this meal
<input type="radio"/> None, I eat alone
<input type="radio"/> 1 to 3 other people
<input type="radio"/> 4 to 6 other people
<input type="radio"/> 7 to 10 other people
<input type="radio"/> More than 10 people
DINNER
<input type="radio"/> I don't usually eat this meal
<input type="radio"/> None, I eat alone
<input type="radio"/> 1 to 3 other people
<input type="radio"/> 4 to 6 other people
<input type="radio"/> 7 to 10 other people
<input type="radio"/> More than 10 people

18. Are you CONCERNED about your PRESENT WEIGHT?
☐ Yes
☐ No

If your answer to this question was NO, you may turn to the NEXT PAGE.
If your answer was YES, please CONTINUE.

19. Which of the following describe your DIETING METHODS?
Mark all answers that apply.

☐ I eat more to GAIN weight. ☐ I no longer eat certain foods.

☐ I skip meals to LOSE weight. ☐ I cut out between-meal snacks.

☐ I cut down on the amount I eat at meals.

20. Are you taking any MEDICATION regularly for weight loss/gain?
☐ Yes (please specify) _____
☐ No

21. How could the DINING FACILITY alter their MENU to aid in your weight program? Mark one answer for each food type.

Food Type They Should Serve:

MEATS	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
VEGETABLE	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
POTATOES	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
BREADS	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
SALADS	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
DESSERTS	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is
DRINKS	<input type="radio"/> more	<input type="radio"/> fewer	<input type="radio"/> different	or	<input type="radio"/> OK as is

17. How much has your WEIGHT CHANGED over the PAST YEAR?

My Low Weight Was:	My High Weight Was:
<input type="radio"/> 1 <input type="radio"/> 2 <input type="radio"/> 3 <input type="radio"/> 4 <input type="radio"/> 5 <input type="radio"/> 6 <input type="radio"/> 7 <input type="radio"/> 8 <input type="radio"/> 9	<input type="radio"/> 1 <input type="radio"/> 2 <input type="radio"/> 3 <input type="radio"/> 4 <input type="radio"/> 5 <input type="radio"/> 6 <input type="radio"/> 7 <input type="radio"/> 8 <input type="radio"/> 9

Food Preference Survey

Instructions

Your answers to the following questions will help the Armed Forces Menu Planners put foods which you want on the menu. This is not a test. We are interested in your opinion so please do not check your answers with your friends.

On the following pages, please indicate HOW MUCH YOU LIKE OR DISLIKE each food and HOW OFTEN YOU WANT TO EAT the food. If you have never tried the food item or have never heard of it, fill in the oval in the first column labelled NEVER TRIED and leave the rest of the line blank.

If you are familiar with a food on the list and would like to eat it, you should fill in an oval in the column 'Like or Dislike'. In order to say how much you like or dislike a food, look at the following scale.

1	2	3	4	5	6	7	8	9
dislike extremely	dislike very much	dislike moderately	dislike slightly	neither like nor dislike	like slightly	like moderately	like very much	like extremely

Notice that the rating of 5 is neutral, meaning that you neither like nor dislike the food.

Ratings below 5 indicate dislike, while ratings above 5 indicate like. Fill in the oval of the number which best describes your feelings for the particular food item. Remember to mark every food item except the ones which you have never tried.

Example:

If you like Danish Pastry very much, you would fill in:

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨

If you dislike it slightly, you would fill in:

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨

After rating HOW MUCH YOU LIKE OR DISLIKE THE FOOD, continue across the same line to the last two columns labelled 'How Often You Want To Eat The Food'. Decide how many days per month you would like to eat the food. If you want a food 3 meals or more on the same day, it should still be counted as one day. For any number of days from 01 to 30, fill in two ovals, one in each column. If you never want the food, fill in the two zeros, one in each column.

Please note the following examples:

Example 1

If you would like to eat a food 18 days per month, you would mark,

⊙ ● ⊙ ⊙ | ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙

As you can see, the number you chose (18) has been filled in, one digit per column. You should fill in only one oval per column, but both columns must have one oval filled.

Example 2

If you would like a food only once a month, fill in 01.

● ⊙ ⊙ ⊙ | ⊙ ● ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙ ⊙

In this example, the number you chose (1) has only one digit. In case this, you fill in the 0 in the left column and fill in the 1 in the right column.

If you do not want the food at all, you should mark the zero in each column.

This is not a survey of how much you like foods served in the Armed Forces. We are interested in how much you like these foods in general. Think of the food in a general way, rather than any particular time you have eaten it.

Remember, if you are not familiar with the food item, mark the first column labelled NEVER TRIED and leave the other columns blank. If you are familiar with the item, then first rate HOW MUCH YOU LIKE OR DISLIKE THE FOOD and then indicate HOW OFTEN YOU WANT TO EAT THE FOOD.

1	2	3	4	5	6	7	8	9
dislike extremely	dislike very much	dislike moderately	dislike slightly	neither like nor dislike	like slightly	like moderately	like very much	like extremely

Appendix D
Food Selection Questionnaire

FOOD SELECTION QUESTIONNAIRE

US ARMY NATICK RESEARCH AND DEVELOPMENT COMMAND

Your answers to the following questions will help the Armed Forces Menu Planners put foods which you want on the menu.

Please indicate on the next page which foods you selected for your meal. Also indicate how many servings you had of each food that you selected. Notice that below each food name is the amount of food that makes one serving.

Please note the following example. If you selected one hamburger, one bowl of green beans, and two glasses of milk, you would mark:

	WHAT FOODS DID YOU SELECT?	HOW MANY SERVINGS DID YOU SELECT?			
		1/2	1	1 1/2	2
	Hamburgers	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	(1 hamburger = 1 serving)				
	Green Beans	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	(1 bowl = 1 serving)				
	Fresh Milk	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
	(1 glass = 1 serving)				
	Breaded Veal Cutlets	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	(1 piece = 1 serving)				

When you have completed the questionnaire, please leave it with your tray on the table. Make sure your questionnaire shows all of the food you selected for the meal, second servings and first servings.

**INSTRUCTIONS FOR PARTICIPANTS IN THE
NATICK FOOD HABITS STUDY
U.S. ARMY NATICK RESEARCH AND DEVELOPMENT COMMAND**

During the past two weeks we have been collecting information about the food habits of men and women who work at Travis Air Force Base. We need your help for the final phase. Participation is voluntary; if you participate, your name will not be used.

To participate in the last part of the study, first, read the next page; second, select your meal from the food line; and third, answer the three short questions on the last page at your table. Please leave the papers with your tray, on the table.

Please do not discuss these papers with anyone. Your participation is appreciated.

FOOD HABITS STUDY

U.S. ARMY NATICK RESEARCH AND DEVELOPMENT COMMAND

As part of our study on food habits, we would like for you to read the following paragraph. Please do not discuss this with anyone.

What does it mean to say that carrots are good for you. Because carrots are an excellent source of Vitamin A, it means that carrots lead to real health and the development of your full human potential. And health and development are conditions of true freedom. Each person has a right to full development and freedom so each person has a right to Vitamin A. This right should not be denied nor should it be a servant of ignorance. Because carrots are a good source of Vitamin A, and because Vitamin A is vital to the total person, people who desire the richest and fullest lives should consider including a serving of carrots in their meal.

FOOD HABITS STUDY

Please provide the following information. When you are done, leave this page and the previous page with your tray.

Please indicate whether CARROTS were included in your meal.

Check One

☐ Carrots were NOT included in the meal.
☐ Carrots were INCLUDED in the meal.

Please indicate your SEX and RACE/ETHNIC background.

SEX Check One

☐ Male
☐ Female

RACE Check One

☐ Caucasian/White
☐ Negro/Black
☐ Other

As part of our study on food habits, we would like you to read the following paragraph. Please do not discuss this paragraph with anyone.

What does it mean to say that carrots are good. Because carrots are an excellent source of Vitamin A, it means that carrots lead to the *normal functioning* of the body. An absence of Vitamin A in the diet has several consequences. First, it causes insufficient production of a liquid in the eye, called the visual purple of the retine, that results in an inability to see in the dark. Second, an absence of Vitamin A causes a softening of the eyes, a dry lusterless condition of the eyes, and lessened resistance to infections. Because carrots are a good source of Vitamin A, and because Vitamin A is necessary for normal bodily functioning, people should consider including a serving of carrots in their meal.

What does it mean to say that carrots are good. First, because carrots are an excellent source of Vitamin A, it means that carrots lead to the normal functioning of the body. An absence of Vitamin A in the diet causes night blindness, softening of the eyes, dry lusterless eyes, and lessened resistance to infections. Second, due to Vitamin A being present in carrots, it means that carrots are conducive to real health and the development of your full human potential. And health and development are conditions of true freedom. Each person has a right to full development and freedom so each person has a right to Vitamin A. This right should not be denied nor should it be a servant of ignorance. Because carrots are a good source of Vitamin A and because Vitamin A is necessary for normal bodily functioning and is vital to the total person, people who desire the richest and fullest lives should consider including a serving of carrots in their meal.

**FOOD HABITS STUDY
U.S. ARMY NATICK RESEARCH AND DEVELOPMENT COMMAND**

As part of our study on food habits of US Air Force personnel, we would like you to read the following paragraph. Please do not discuss this with anyone.

What does it mean to say that overeating is bad. Because overeating causes people to be overweight, it means a greater chance of poor health and of a shortened life. And poor health means that people are deprived of their full ability to act freely. Overeating, therefore, can mean a premature death and the loss of freedom. Each person has a right to life, freedom, and the happiness that accompanies real health so each person has a right to eat nutritious foods low in calories. To deny this right is to deny a time when all men and women live a rich full life. Because desserts are often high in calories and because overeating can mean a shortened life with less ability to exercise one's freedom, consider not including a dessert in your meal today.

FOOD HABITS STUDY

Please provide the following information. When you are done, leave this page and the previous page with your tray.

As part of our study on food habits, we would like you to read the following paragraph. Please do not discuss this paragraph with anyone.

What does it mean to say that overeating is bad. Because overeating causes people to be overweight with large amounts of fat being stored in their bodies, it means a greater likelihood of poor health and a shortened life. Being overweight is associated with physical unattractiveness, reduced physical fitness, diabetes, hypertension, and heart disease. Half of all deaths in men aged 50 are caused by heart disease; almost half of all deaths in women are caused by heart disease 10 years past menopause. Almost one out of two people overeat and are overweight. The intake of foods high in calories but low in nutritive value contributes most to making people overweight. Because desserts are often high in calories and because being overweight can impair health and shorten life, consider not including a dessert in your meal today.
